ABSTRACT

Abbellyo Wholesale Store is one of the businesses engaged in the wholesale sale of basic necessities in Yogyakarta. The problem that occurs at this time is the sales process which still requires customers to come to the store and then the lack of wide range of promotions used by Toko Aneka which still uses banner media in front of the store. The process of storing data and printing reports is still done using records into the archive, it is considered ineffective and inefficient. With the various problems faced by Toko Aneka, a website-based sales information system is needed to make it easier for customers to buy goods and as a promotional medium, simplify the sales process that can be done online, and can make it easier to process data and print reports that no longer require recording. in the form of archives so as to minimize errors in reporting. The steps used here are more directed to the research process using the waterfall step. The system is made using the PHP programming language and implements midtrans as an online payment method. From the results of this study it can be concluded that the web-based Sales Information System takes place online and is well computerized.
