ABSTRACT

SMP Negeri 3 Kesugihan is one of the educational institutions that organizes the learning process, the role of teachers and guardians of students is very influential in the student learning process, but the busyness of the guardians of students becomes an obstacle to be able to continue to monitor the progress of their children's learning process at school. Therefore, a student monitoring system is needed which has a very important role to monitor student progress at school. The student monitoring information system contains information about student activities, student learning outcomes and student attendance. The research method used in building the monitoring system uses the waterfall method. By building a student monitoring system, it can help parents in supervising and monitoring children so that they can build better student personalities and are able to make students potential in teaching and learning activities at school. This information system is built using a web-based Laravel framework. All processes contained in the student monitoring system have been tested and can still be further developed in mobile form.
