## **ABSTRACT**

*PT. Ceria Prima, located in Bengkayang Regency, West Kalimantan, is a company engaged in the plantation industry. The assets owned by this company are in the form of land, buildings, machinery and others. Asset management at PT. Ceria Prima has deficiencies in asset management due to lack of information and errors often occur in asset data, miscalculation of asset values, accumulation of excess files, searching for data that requires a lot of time and the time needed to manage assets is still not effective. There was research on this problem before, and a solution was made to solve the problem by analyzing and designing a system that could assist companies in managing their assets in the form of a Company Asset Management Information System. This research report is a continuation of previous research, where this research continues the process of implementing and testing the system based on the results of the analysis and design of previous research. The methods used in this research are the observation method, the interview method, the documentation method, and the waterfall method. The results obtained are the implementation and testing of the proposed system to assist companies in managing assets. It can be concluded that the results of the analysis and design in previous research can be implemented with several changes and from the tests carried out the system is quite feasible and can be developed further.*
