ABSTRACT

CV. Indoutama Group is a company engaged in the field of perfume, production and sale of perfume. The problem at CV Indoutama Group is the process of recording stock inventory which is done manually by writing in a book. This causes an error in recording the supply of goods which will affect sales. In the process of managing inventory, errors often occur in recording incoming and outgoing goods. This causes inaccuracies in the recording of incoming and outgoing goods transactions which can cause losses. In addition, errors often occur in writing down the number of products available, then stock reports are not neatly arranged and sometimes some are damaged or lost because they are still done manually. Therefore, this research creates an inventory management information system that is useful for facilitating companies in managing incoming and outgoing goods. So, this can overcome problems in recording that still occur in the company.
