

ABSTRACT

This study aims to design a data processing website. Websites are designed according to information needs that are increasingly advanced along with the development of very fast computer technology, both in terms of hardware and software. This system is designed using XAMPP software, PHP as the programming language used, MySQL as database management, and browser. Thus the design of an information system requires accurate data and information so that the designed information system can meet the desired needs. The system includes data input modules relating to the latest information on employee data, position data, review data, payroll data and other data useful for the company.

Keywords: *Information System Design, Data Processing, Website.*
