## **ABSTRAK**

*Special schools are schools intended for children with special needs (ABK). ABK is a child who has a development chart that is different from children in general. The function of the special school itself is to provide education according to his abilities. The lack of means of conveying information from schools to parents is a frequent obstacle. Guardians of students often do not always supervise students at all times, so that information given from schools to parents of students is often not conveyed through these students. In this case to support the provision of information and communication between teachers and parents of students, this research was conducted. By observing directly at SDLB Karangrejo and collecting administrative registration data which aims to create an information system for new student admissions with the WhatsApp gateway. Besides being able to record data on new students, the system has a menu for sharing information and announcements. The results of this study, the process of registering new students can be done more easily because the administrative process is carried out mobile from home. Information and announcements that will be submitted can be directly received by student parents through the system.*
