

## **ABSTRACT**

*In the information systems study program, University of Technology Yogyakarta has post-Judiciary KP & TA services. The service is carried out through the Goggle site address belonging to the study program. Students can complete the data through the site address, then the study program admin will confirm what is needed via short message. From this activity, the study program admin must confirm repeatedly via short messages to students due to lack of data. In some cases, the personal data collected by students does not match the data in other files. Students must also collect data repeatedly or are asked to meet the study program admin many times until the data is declared appropriate. With these problems, a system was created that was used to complete the post-seminar practical work files, post-final project impromptu exams, judicial registration to complete the points of 10++ students. The system created is able to overcome the problem of lack of data and data errors, in terms of 70 test scenarios with a 100% success rate. To make it easier for students to collect data, the design is made based on WEB which aims to allow students to access anytime and anywhere.*
