

ABSTRACT

Inventory means storing goods intentionally as reserves for future needs. Inventory of goods in a trading activity plays a very important role. Manual recording often results in a problem of inconsistency between the data on the goods that come out and the written data. The manual data search process also takes a long time. For this reason, the Rishaka Beauty Shop needs good control to protect company assets. It is hoped that the use of a computerized inventory system can be a good solution to reduce the risk of data loss. Rishaka Beauty Shop is a shop that sells beauty products such as skincare. The skincare sold at the Rishaka Beauty Shop is the Glamshine brand, which has many products including basic packages and also various types of serum. The aim of this final assignment is to design an information system for recording goods, which can manage incoming goods, outgoing goods, and also stock of goods. Later, the result of this design will be Web-based inventory recording.
