

## **ABSTRACT**

*The Plastic Goods Industry is an industry that carries out the recycling process of plastic waste into plastic pellets which will later be distributed to several plastic and raffia factories in Sragen district. Plastic pellets are clear colored granules and are made from a chemical called styren monomer. The original plastic pellets were made from styren monomer. In managing sales data, there is a problem in the absence of a computerized system for recording sales reports which still uses ledgers to record sales data so that it can result in errors in recording or writing sales reports, damage, loss, even fraud in recording sales data, as well as fraud in manipulate data. In the ordering system, DFD, ERD diagrams are used, reports use the PHP programming language, and MYSQL for database processing. The author hopes that the system created can help admins record existing data and make it easier to create reports.*
