

ABSTRACT

Amira Bakery is an agency that operates in the cake and bakery sector. Currently, the sales and financial system running at the Amira Bakery still uses a manual system. This system has shortcomings such as problems recording sales and financial transactions, which are caused by books that are easily damaged and manual calculation of total payments in the sales recording process takes a long time due to the large amount of data and the data being difficult to read. One solution to deal with this problem is to create a sales and financial information system. The method used in this research was the waterfall method and carried out observations and interviews with shop owners. The results of this research are a design for a web-based sales and financial information system. This system is expected to minimize errors in recording and making reports on sales and finances at the Amira Bakery.
