ABSTRACT

The process of managing assets belonging to CV Inti Kreasi does not yet use a recording information system so that the company does not have a good inventory report. This can result in the company having difficulty finding a list of goods or assets if they are needed again at any time and CV Inti Kreasi also experiences loss of data such as the year the goods were purchased and also the estimated price of the goods. Therefore, an asset inventory information system will be implemented which aims to manage assets. Asset management can take the form of recording incoming assets, managing asset layout, and also reporting assets. The methods used are system analysis, requirements analysis, system implementation, interface implementation, and system testing. The results of the analysis and system testing carried out can be used to manage procurement data, room data, incoming asset data, outgoing asset data. In addition, it can display procurement reports, incoming asset reports, and outgoing asset reports. The success of system testing that has been carried out is 96.42%.
