ABSTRACT

A sales report is a document that describes how many sales a company makes daily, weekly, or monthly. However, because Warung Makan Bakmi Alam Bogor does not yet have a computerized system to manage its sales results, there are several problems, especially when the cashier adds up the food purchased, sometimes errors occur when the buyer is making payment. The owner also finds it difficult to see the amount and what he has sold. Sometimes the income from sales is not the same as the amount sold, therefore a system was built that can connect the cashier application, with a sales results monitoring system using a web service, by implementing the REST method in the application, so that Bakmi Alam Bogor owners will more easily monitor the results the sales.
