ABSTRACT

Housing needs in Indonesia show a sharp increase. This increase certainly has a positive impact on building materials businesses, one of which is roof tiles. The increase in roof tile orders is still not supported by online applications. The process of ordering roof tiles is generally done by going directly to the roof tile seller or manufacturer so it can take a lot of time and is inefficient, so an Android-based roof tile ordering application was built. This application is made on Android because consumers only need a smartphone to order roof tiles. This will of course be more effective and efficient because it can reduce time and costs. The application development method uses the Agile concept. With this application, users can choose several tiles to order, then a rating for each tile is also available from the highest rating to the lowest rating. This application also provides specifications for each roof tile.
