ABSTRACT

Sexual harassment has become an increasingly disturbing issue in today's society. Sexual violence reaches various age segments, including children, teenagers and students on campus. The causes of the increase in cases of sexual harassment can be attributed to social factors such as public opinion, weaknesses in law enforcement, deficiencies in education, and a decline in the level of spirituality. In addition, the choice of clothing and misperceptions by certain parties further exacerbate this situation, resulting in victims tending to be reluctant to report incidents that occur. Women and men are equally vulnerable to becoming victims, with a variety of cases that are complex and difficult to analyze thoroughly. Therefore, the development of a sexual violence complaint application is a crucial initiative in addressing this problem, allowing victims to report incidents and consult with psychological experts more easily. This research aims to design an application that not only facilitates reporting the chronology of events, but also offers a simple interface design and is directed towards victims and psychology experts. The ultimate goal of this research is to create a technological solution that can provide a platform for victims of sexual harassment, reduce the number of cases that occur on campus, and provide relevant survey data for further analysis.
