ABSTRACT

In the era of technology, information systems play a crucial role in enhancing the registration services for prospective students. The use of paper forms at Smartgama Learning Center presents challenges such as difficult access, complex administration, the risk of data loss, and slow registration processes. This study aims to develop a registration and payment information system for Smartgama to address these issues. With this system, students can register online without having to visit in person. The system also includes features for printing registration and payment data, as well as graphs depicting student enrollment growth, thus making the registration process more efficient and integrated.
