

ABSTRACT

Benediccio Store is a shop that sells various kinds of shoes located in Sleman. Over time, many customers have known this shop, causing a surge in orders every day throughout Indonesia. Because of this, errors often occur in transactions, ranging from errors in the type of goods and also errors in shipping. The purpose of this study is to design and implement a sales information system that will later be used as a place of transaction between the owner and customers outside the city to facilitate their transactions. In the initial stage, what is done is to analyze the system needs and then continue by designing a system based on needs. The next stage is to implement the system created for the shop to help the owner run his shop.
