

ABSTRACT

The development of information technology has made many companies begin to develop their administrative systems, one of which is hospitality. One of them is by using a website-based application. The system can process room - booking data such as check-in, check-out, and calculation process. The room reservation information system in Tunjungan Indah Hotel is built by using the PHP programming language and PhpMyAdmin as tools to help data processing. The hotel room reservation information system can ease the receptionist and also the client in making a room reservation. In addition, visitors can find out information on hotel facilities at Tunjungan Indah Hotel and also can promote hotels through the media website.

Keywords: Information System, Reservation, Check-in, Check-out.
