

## **ABSTRACT**

*As one of the duties of the student unit at SMA Negeri 1 Minggir is to record the activities and behaviors of the students, such as: violations, achievements, and extracurricular activities. Students processing data is still written manually and computerized with Microsoft Word and Excel applications, which need a lot of time and energy. Students sometimes do not know how many points of violation they have got, and what sanctions they will get. The purpose of this final project is to create an application that can process student data and information. The method used was data collection through observations, interviews, literature study, system analysis, system implementation, and system testing. The system design was conducted using Sublime as the editor, the PHP programming language and MySQL as the database. Hopefully this system could make the responsible ones easy in doing the duties.*
