

## **ABSTRACT**

Laundry is one of the service businesses in Yogyakarta. Laundry services have the opportunity to increase their business, so the writer designs a GIS based laundry service information system. Designing system in making e-commerce website for laundry is developed using some software which are sublime programming language with the aid from PHP-MySQL database and made on several steps, starting with making database, making navigation structure, designing display and program. The purpose is for people can easily find the nearest laundry service quickly. With this system, consumer can find where the nearest laundry services are. The final result of the software design is to create a web based laundry service information system that can be applied in a laundry service, so that, system can be accessed by many people especially web visitor (customer) to find the nearest laundry location.

**Keywords:** Information System. Laundry, GIS (Geographic Information System)
