ABSTRACT

The Siak Regency Tourism Office is one of the governments that has governmental affairs in the cultural and tourism sector based on the principle of regional autonomy. In improving the tourism sector in Siak Regency at this time, the Siak Regency Tourism Office still does not have a website that directs users or visitors to the existing information system. If there is, visitors can only see information in the form of information about the tourist attraction with a description / brief description of the object, and its supporting facilities such as accommodation, transportation, restaurants, souvenir shops, and other information that can only be read. To solve this problem, we need a web-based information system for booking entrance tickets and hotel room reservations in Siak Regency using the waterfall method. The resulting information system is expected to make it easier for visitors if they want to order entrance tickets. In addition, visitors can also make choices about which tours to visit according to the budget they have. With this it makes it easier for visitors to come to tourist attractions in Siak Regency.
