ABSTRACT

Computers have become the main tools in every human activity. Not only for business needs, but also in daily activities of every need. This proves that computers have become part of human tools for job roles. This research, which was conducted at TOKO POJOK, focuses on processing inventory and sales data. The purpose of the system to be designed is to be able to solve problems ranging from manual processing of inventory and sales data, inaccurate information presentation processes to inefficient time. In order to solve existing problems, this research uses data collection methods, namely interviews, observations, and literature studies to analyze the needs of the sales and inventory information system as well as the programming languages used, namely HTML and MySQL as a database.

Keywords: information systems, sales, inventory
