ABSTRACT

Chicken Hitz is a restaurant & cafe located on Jalan Perumnas 01, Condongsari, Condongcatur, Depok District, Sleman Regency, Yogyakarta Special Region. In this restaurant & cafe, the sales information process is still inefficient because the recording of sales, inventory, procurement, and profits is still recorded in the book manually, thus hampering the performance of the restaurant & cafe. Based on these problems, a Web-based Sales Information System Design is made to handle the sales process and stock procurement. The method used in this study is a qualitative method with data collection techniques through observation, interviews, and documentation, which consists of analysis, design, and implementation. This system is built using HTML and CSS as a display system, PHP as a programming language that provides functions, MySQL as a database server, and Sublime Text as a visitor. The Sales Information System is expected to be able to assist the owners and employees of Chicken Hitz in handling the sales process to increase the effectiveness and efficiency of the restaurant & cafe performance.
