ABSTRACT

Currently, an education requires an information system to be able to assist in managing useful information. With the academic information system, students can access information related to academic activities anywhere, thus helping the speed and quality of information delivery. Dharma Wanita SMPLB still uses Microsoft Word and Microsoft Excel in managing data. This can lead to the risk of data loss and data security insecurity and lack of information that should be needed by the student guardian. The purpose of this research is to produce a web-based information system design to make it easier for admins to manage student data, teacher data and value data and to be able to provide student grade information for student guardians without having to ask the Administration.
