

ABSTRACT

The Makmur Abadi Farmer Group is the embodiment of a forum that is needed by farmers for the development of their agriculture. This group was built together for the convenience of each member in farming. Lack of marketing of products by farmers is also a factor that influences farmers to choose to sell their crops to collectors and agents so that the crops can be sold quickly so that they get capital to continue their farming. Android-based applications can be the right place to market farmers' crops quickly so that an idea is created to create an android-based agricultural product sales system as a solution to solve the marketing problems of farmers in the Makmur Abadi farmer group. The creation of an Android-based agricultural product sales system is expected to increase farmers' sales. The Agricultural Product Sales System can make payments by account transfer or the cash on delivery system. The Agricultural Product Sales System is built with Android Studio with a minimum Android operating system version 6.0 Marshmellow.
