

ABSTRACT

PT. Ardhian Sebelas Utama Visi or commonly called Ardhian Transport is a business entity that operates in the tourism bus rental sector. Currently, the information on the buses to be rented has not been computerized, making it less effective. The form of bus rental transactions at Ardhian Transport still uses a manual system, manual here, namely managing tenant data, bus data, tenant data that is still recorded in books which are more prone to recording errors or the risk of damage and also loss of data caused by human error. Renters must visit the Ardhian Transport office to rent a bus. The development of a tourist bus rental information system at Ardhian Transport is a step to increase bus rental, so that it can provide benefits for the company. The purpose of building a tourist bus rental system is that tenants can rent buses without having to come to Ardhian Transport. The company can also solve rental problems so that it makes it easy for tenants to get information about tourist bus rentals. This system was built using the PHP (Hypertext Pear Preprocessor) programming language, MySQL database, with SublimeText as a tool and Google Chrome as a support. The result of this research is the implementation of this bus rental application at Ardhian Transport so that it can be used as a tourist bus rental facility that can be accessed anywhere and anytime.
