

ABSTRACT

The clinic is a small public health facility that is widely used by the community for treatment because it is easily accessible by the community. The Nintara Husada Primary Clinic is a clinic located in Winong District, Pati Regency. The general polyclinic at the Husada NCO only treats minor ailments such as fever and so on, while for more severe illnesses, a referral letter is given to the hospital. The process of registering patients and storing all files containing patient identity records and medical record data records here are still done manually by doctors by recording them in a notebook. The data collection method was done by interview and observation. Tools used to build information systems are PHP for programming language and MYSQL as database server. To speed up doctors in providing services and make it easier to process medical record data, the authors built an information system to assist medical record data processing. This information system is expected to provide convenience in processing data. This information system is expected to assist the service process which includes patient registration, computerized medical record data processing.
