

ABSTRACT

Percetakan Munawar is a company engaged in printing, where this company serves various office needs as well as other needs such as printing invitations, printing id cards, printing brochures, printing notes, and others. The problem experienced by these companies is the process of marketing and ordering its products still using conventional methods. If you want to order the products you need, consumers must come directly to the print shop. This of course will have an impact on the inefficiency of time and also costs. Looking at the problems that exist, the authors make an information system application that aims to increase sales figures, production and company finances, where the system developed can provide information services and convenience for customers in ordering products online. The programming language used to build this sales information system is Pascal using the Embarcadero Delphi XE8. Database processing using MySQL.

Keywords: Ordering, Online, Android.
