

ABSTRACT

One of the problems faced by pregnant women is the lack of services to collect information on complaints during their pregnancy. Currently, computer technology has developed as a means of processing data and producing information. One solution is to have a system or application to get closer to the service in accommodating complaint information to pregnant women in order to make it easier to diagnose the illness they suffer. In the application of this system, the Certainty Factor method is used which can diagnose several types of diseases that are often experienced by pregnant women. This system can help pregnant women obtain diagnoses of diseases related to pregnancy health that are fast and relatively inexpensive and find solutions to these diseases by paying attention to the symptoms they feel. With this web-based system, system users can do it anywhere and anytime.
