

## **ABSTRACT**

Dewanda Putra Jaya is a business engaged in bus rental in the city of Klaten. The problems that occur at Dewanda Putra Jaya are in the information system and transaction data collection section. The system currently running is still done manually so that the speed in obtaining information and the accuracy of the information obtained is not guaranteed. The purpose of this study is to overcome the problems that exist in it, so that the information system obtained is clear and from the system or transaction reports is also clear. This system is based on android, it is considered more suitable because of the increasingly modern times. With Android is also more practical because it can be carried anywhere and can transact anywhere. This system can display data on goods, transactions, payments via the application and for the admin there will be transaction reports. The making of this system uses Android Studio, the language uses Java and the database is Firebas.
