

## ***ABSTRACT***

*A financial management information system is an information system that provides information to individuals or groups of people containing financial problems and information about the flow of money for users. Financial management information systems are used to solve financial problems. Therefore, technology media that can solve financial problems are needed and produce financial information to related parties quickly, safely and accurately. One example of developing information technology today is computer technology and the internet. Starting from these financial problems and technological advances, the authors created a website-based financial management application program to make it easier for those who carry out financial management and supervision.*
