

## **ABSTRACT**

*BUMDes (Village-Owned Enterprises) Sidoguro Jimbung is one of the companies that manages natural or human resources that can be processed into the village's original income. With the village's original income, many local people feel helped and entertained by the business sector created and managed by the Jimbung BUMDes. In supporting these activities, BUMDes Jimbung records the entire process manually, such as using a book with the help of Microsoft Excel. The process, which is still manual, makes time ineffective and efficient and the risk of errors can occur when recapitulating data. With this problem, BUMDes Jimbung needs a system to facilitate performance in managing sector data, as well as increase time in a more effective and efficient manner. The implementation of this system will be designed using the HTML5, PHP and MYSQL programming languages as the database. With the implementation of this sector's data administration governance system, it can overcome the problems that occur when recapitulating data, and can make it easier for officers to manage the BUMDes Sidoguro Jimbung business sector.*
