

ABSTRACT

The need for fast and accurate data processing is required by every organization and agency. CV. Seken is one that requires a system that is fast in processing employee attendance data so that it can produce data that can be used to calculate employee payroll. Based on the analysis of the running system, the results show that the current system still has shortcomings, namely the lack of an accurate, fast and precise attendance and payroll recapitulation system. Because the attendance and payroll recap system in CV. Seken is still manual, using print attendance and calculating calculators for payroll. The purpose of making this system is so that the finance department can evaluate the amount of salary based on attendance. In the future it will be developed in terms of attendance discipline.
