

ABSTRACT

CV. The Everest Project is a business engaged in the manufacturing industry. So far, determining the cost of goods manufactured is still using bookkeeping and excel. When there is an order for a new product, it is necessary to calculate COGS again. It will take a lot of time in determining the profit and loss of each product that is produced. As a solution to this problem, a system for determining the cost of goods manufactured using the full costing method will be created so that it can calculate the profit and loss more quickly for each product. This system is built using the PHP (Personal Home Page) programming language as the programming language and MySQL as the DBMS. It is proven by the trial calculation, the profit and loss of each product can be obtained faster

Keywords: *Cost Price, Full Costing, profit and loss*
