ABSTRACT

Outbound and paintball package ordering system at CV. Kompas Adventure is still using the old method, namely manual ordering and marketing, which still uses brochures and social media distribution, so it doesn't use technology that is integrated with data storage. This study aims to create a system that is useful for ordering online, namely with a website and making it easier for customers to order outbound and paintball. This system can indirectly increase the income of the CV company. Compass Adventure. The method used is the waterfall method, namely by analyzing directly what is happening in the field, so as to get data directly from the source directly so that the data obtained can be objective and valid. This website-based outbound and paintball package ordering system uses a mysql database. The outbound and paintball package ordering system application, in addition to making ordering easier, is also useful in recording order data for employees and owners in the CV Kompas Adventure company.

Keywords: *System, ordering, outbound and paintball, website.*
