## **ABSTRACT**

*Technological advances are increasingly rapid and have various benefits for institutions/organizations, such as booking a tour package that requires a booking management to run effectively, efficiently, quickly and accurately. This encourages the emergence of applications to overcome existing problems, because lagging can hamper performance. The booking system at Tugu Wisata still uses the telephone to order. Next, the customer fills out the form for ordering, so many customers don't know the specific destination and price of each package. To overcome the existing problems, a web-based tour package booking information system was designed with the aim of helping to expand promotions and increase company profits. This booking information system, is designed to facilitate the admin's work in serving customers who will order tour packages. The stages in this method are requirements analysis, system design, implementation, testing and maintenance. The information system that will be built makes it easy to get information for the public, especially those who want to know about tour packages. The results of this study are admins can manage package data, website management and print orders. These websites are very helpful in promoting the service offerings.*
