ABSTRACT

Mina Tunas Baru is an agency engaged in selling fish, especially fresh fish products. In carrying out its sales activities, this agency uses a straightforward method; namely, the buyer must meet the seller directly at the store that has been provided. Of course, this can still be developed by creating a sales medium that removes time and distance restrictions. Therefore, this research was created to create a sales information system that can support the ecosystem of selling fish every day. This information system is made in a website using PHP as the programming language and MySQL to provide flexible access to its users. In addition, this information system is also equipped with a payment gateway to handle non-cash payments, which is currently a trend in Indonesia. This information system has several key features: Online payment method using Midtrans payment gateway, order delivery, and order data management files. By implementing these features, the information system makes it easy for fish lovers can buy fresh fish more easily because they do not need to come directly to the store. The research result is a system that can facilitate the purchase of consumption fish and the recapitulation of sales data.

Keywords: *Information Systems, Fish Sales, Website payment gateway.*
