## **ABSTRACT**

Android applications have been widely used by the public and are used in various fields, especially the information field. Information obtained from applications that have been made can vary depending on what applications are run on Android used, such as chat applications, social media, and various other applications. Android applications are also used to obtain human data information, including human data itself. However, most personality tests are still done manually. For this reason, in this study, an android application will be made to obtain information about a person's personality so that people will quickly obtain information about their personality. Personality tests were conducted using the Dominance Influencer Steadiness Compliance (DISC) method. The system will conduct an assessment of the personality test results. Thus, someone knows his personality and other people's personality. The personality test results will motivate a person to be better and develop strengths in the previously unknown field and improve their shortcomings.
