ABSTRAK

Indonesia is still fighting the Coronavirus, and the number of Coronavirus cases has continued to rise as of June 30, 2021. Some people have reported healing, but others have died. A system that monitors Covid 19 cases is required to track the progress of Covid 19 digitally. There are currently several websites or programs dedicated to Covid 19 information; however, most of these websites or applications do not focus on Covid 19 instances, resulting in a lack of all necessary information." "Mobile Development Covid 19 Information Using the Flutter Framework" is a plan to develop a COVID-19 application that will provide you all of the information you need about Covid 19 in one location (one-stop place). This program uses Google's Flutter SDK, a Dart-based framework that can operate on various operating systems. Brief UI/UX creation, Architecture Review, and Development are all steps in developing this app. The spread of Covid 19 and news, treatment, and symptoms will be fed into the system utilizing the Rest API.

Keywords: *Corona Virus, Covid 19, Flutter, Dart, API*
