ABSTRACT

Wedding invitations are needed to make an event so that people who want to be invited can know the event that will be held by the bride and groom. Made with an elegant and unique design, the invitation is made as good as possible so that those who receive the wedding invitation feel happy. This increasingly modern era and increasingly sophisticated technology make it easier for every job, one of which is ordering. Ordering wedding invitations now feels easy because there is no need to come to any place. We can even order from out of town. Many owners of invitation printing sites currently use website-based applications. However, it is undeniable that there are still those who have not implemented a website-based ordering system. There are still many who can only go through WhatsApp or come directly to the place. In the application development of a website-based wedding invitation ordering information system owned by Papermint, the author will add features to the application, after which the system is implemented. The purpose of developing this website-based ordering system is so that service to customers is of higher quality and of course also ready to compete with others.

Keywords: *Wedding invitations, information systems, ordering, website, development, implementation.*
