

## **ABSTRACT**

*Dasawisma is a group of housewives consisting of two to four people in one RT. Each member of the dasawisma is responsible for 10 to 20 neighboring houses to facilitate the running of a dasawisma program itself. The task of the Dasawisma group is to manage data such as resident data, family data, and residents' residence data, make reports and submit reports to the sub-district for further use of the data by the Rukun Warga, Rukun Tetangga and/or PKK according to their respective needs. With a large population and limited working time, problems often arise with the speed of obtaining the information needed, such as information on residents and information on the environment in which they live. To overcome this problem, a system is needed which is expected to assist in data management such as citizen data in terms of updating or adding citizen data, data on houses and the environment around the place of residence, and making reports. Dasawisma information system is designed on a web basis so that it can be accessed easily.*
